

Prerequisite:

OS: Centos

RAM: 6 GB

Storage: 50 GB

Fast internet

Script installation:

The easy way to install optima is to run the installation script

Go to optima directory, after unzipping the file run:

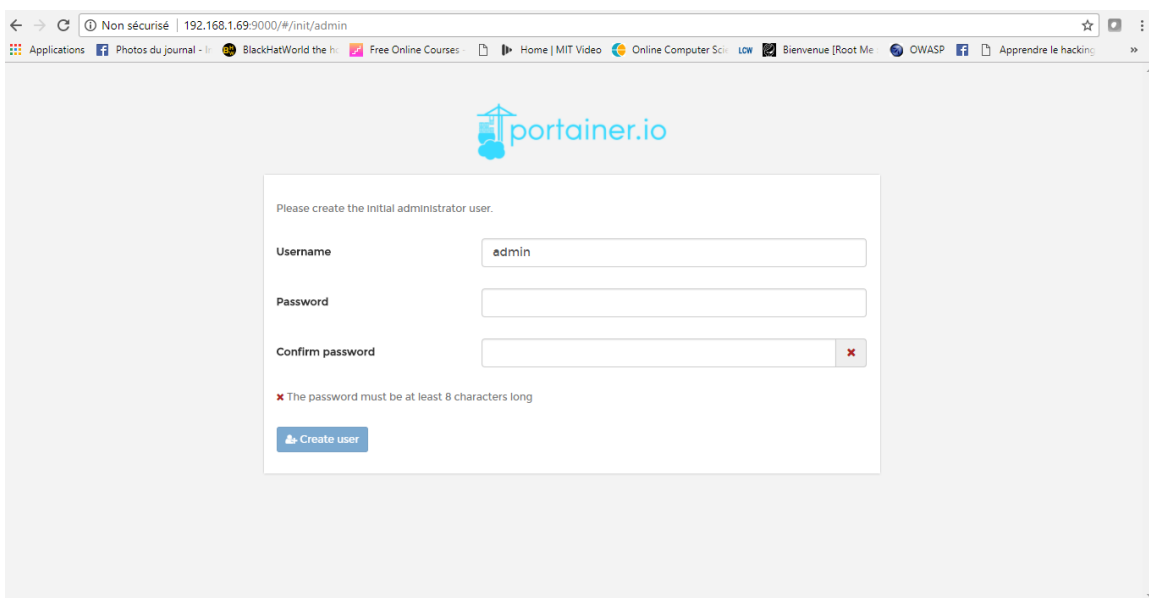

```
cd optima
```

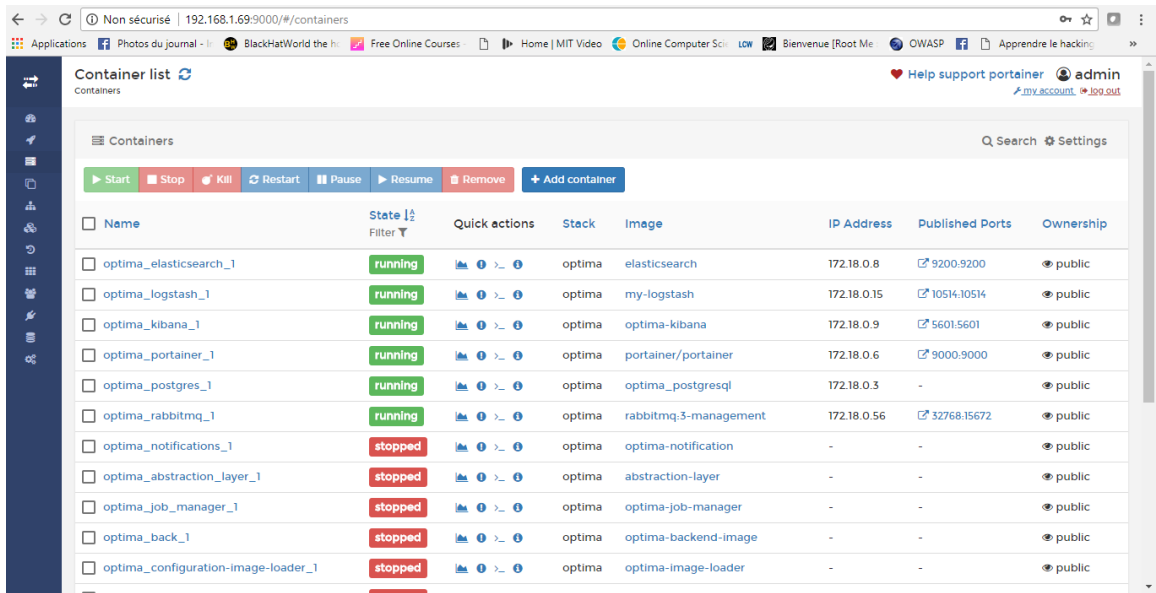

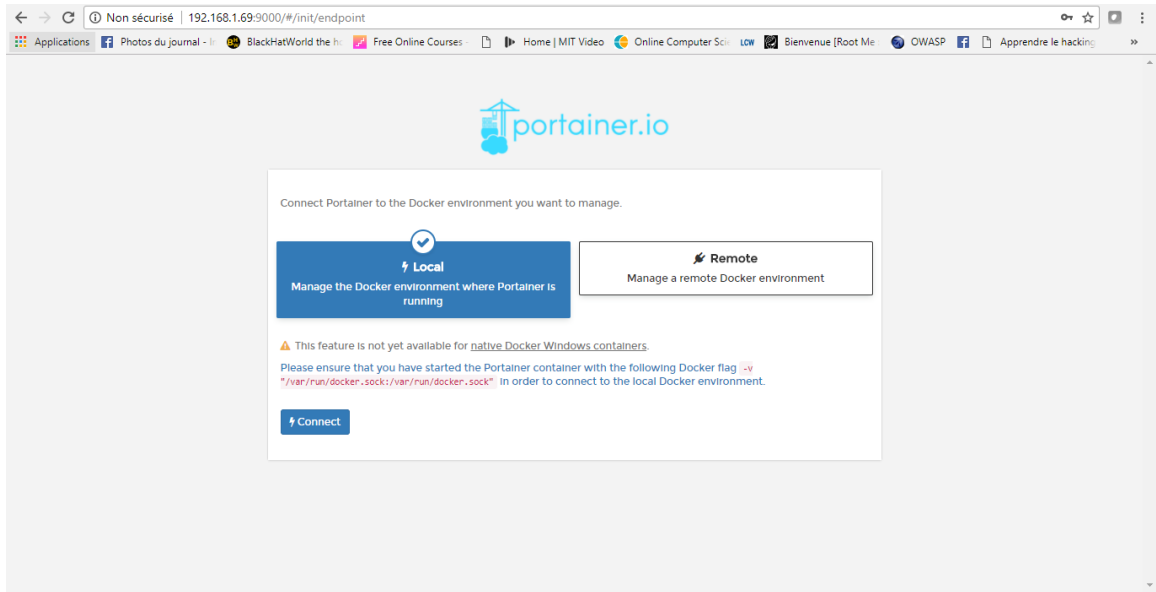

```
start-optima ipaddress
```

ipaddress : is the ipaddress of the host when we want install optima

Configure Portainer to manage the containers:

http://ipaddress:9000

If we have any stopped container we can see the logs of this container:

Container details

Containers > optima_configuration-image-loader_1

Add binding from this exchange

To queue configuration_differ_precheck

Routing key: configuration_differ_precheck

Arguments: = String

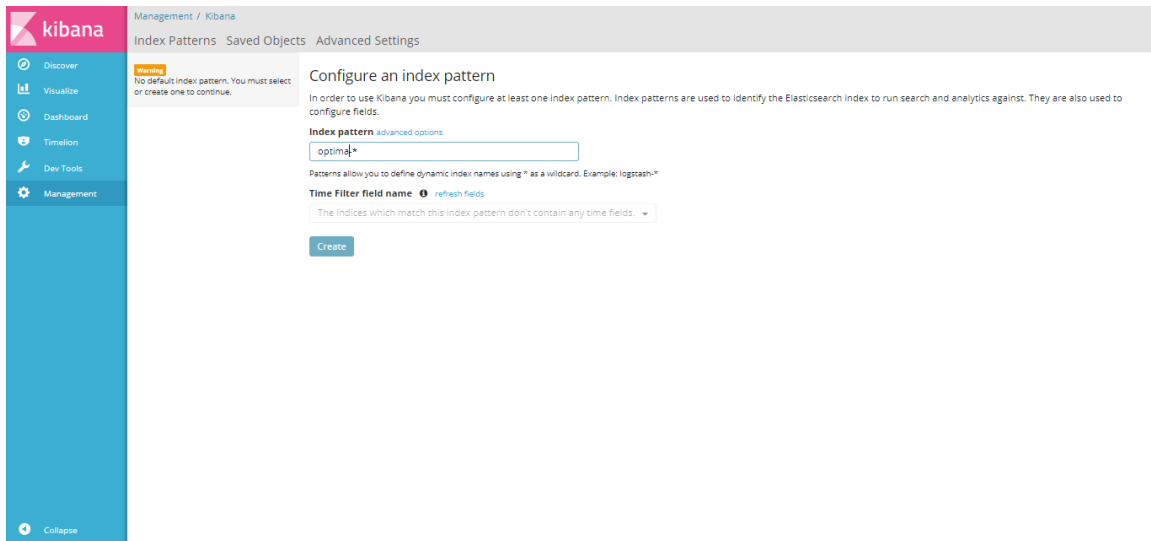

Bind

Configure ELK stack:

Index pattern : optima-*

If the index is not found please send the next PUT:

```
curl -X PUT http://ipaddress:9200/optima-<date>
```

If all works well optima is ready, and the login and the password are:

Login: admin

Password: admin

In case of authentication problem:

Please execute the following command:

```
docker exec -it optima_postgres_1 /bin/bash
```

we are now inside the container:

```
su - postgres
```

```
psql -d optimadb -f /home/init.sql
```

```
exit
```

```
exit
```

optima_postgres_1: is the default name of postgres container we can change it by the name mentioned in Portainer.

In case of problem to start optima:

Go to portainer and start all stopped containers, and see the logs for the stopped ones.

If you have any other problem don't hesitate to contact me : Hamza EL-HAFYANI
